## Forwarder Pushes Logs

### JVM Metrics

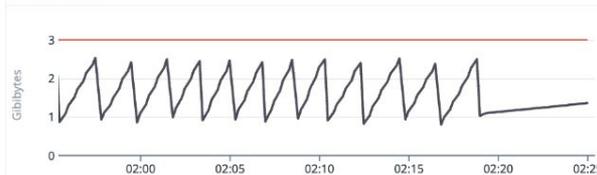

#### Thread Count

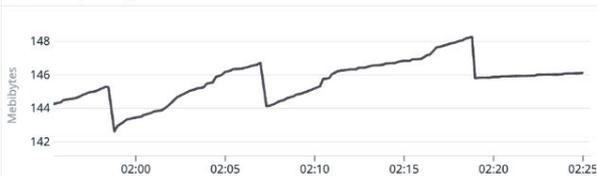

#### Number of Classes Loaded

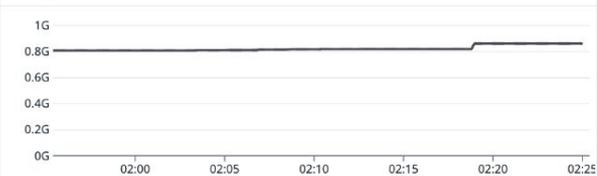

#### Heap Usage

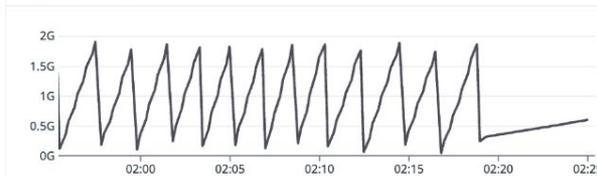

#### Non-Heap Usage

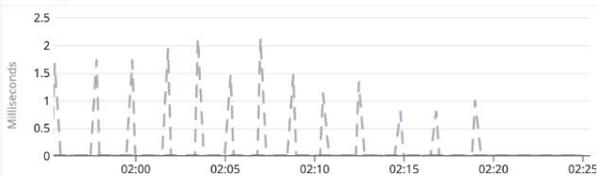

#### GC Old Gen Size

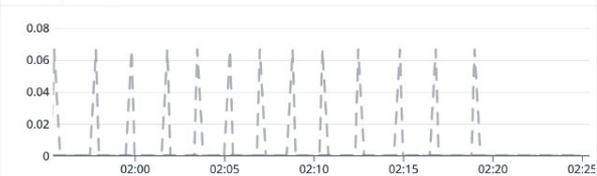

#### GC New Gen Size

#### GC Major & Minor Collection Time

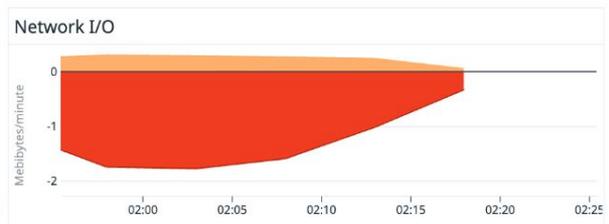

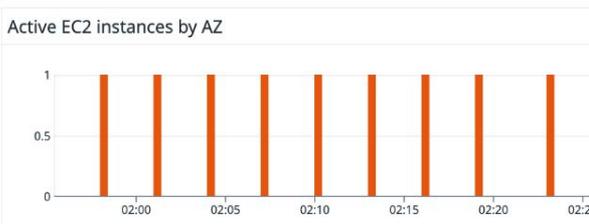

#### GC Major & Minor Collection Count

### EC2

See the [AWS EC2 Overview](#) dashboard for more in-depth explanations and visualizations of EC2 usage and performance in an aggregate view or at an individual host level.

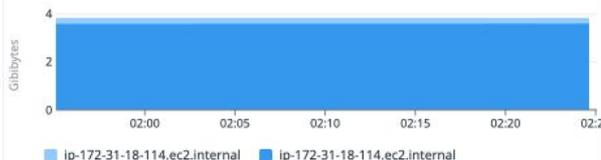

### Agent Metrics

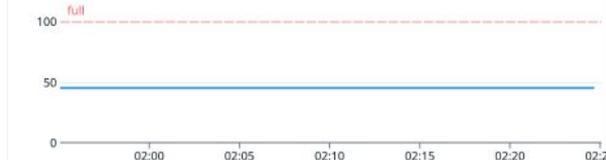

The following widgets contain metrics generated by the Datadog Agent. They are most beneficial when filtered by a single host.

It is best practice to install the datadog agent on all EC2 instances to get more metrics such as memory usage every 15s along with 150+ agent integrations to monitor what is running on your EC2 instances. [See the installation instructions](#) for more details.

#### Memory Breakdown

#### Disk Usage by Device (%)

#### Available Swap

#### Load Averages 1-5-15 Min

#### Disk Latency by Device

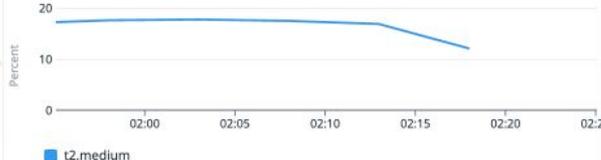

### CPU

CPU usage is one of the prime host-level metrics to monitor. Depending on the application, consistently high utilization levels may be normal. But if performance is degraded, and the application is not constrained by disk I/O, memory, or network resources, then maxed-out CPU may indicate a resource bottleneck or application performance problems.
